

RAIN

Rainwater Harvesting Implementation Network

RAIN water: towards a MUS approach

*MUS Group meeting,
Rome, 24th August 2009*

Kirsten Neke

RAIN

Rainwater Harvesting Implementation Network

1. The RAIN Foundation - introduction
 2. RAIN and Multiple Use water
 3. Country programmes
-MUS advise: case study Ethiopia

1. The RAIN Foundation – introduction

RAIN envisions a world in which all people have access to a reliable source of clean water, thereby being empowered to improve their lives through better health, food security and education.

RAIN – beginnings

-- Established 2003 in the Netherlands

What does RAIN do:

- Provide access to (safe) water through collection of rainwater
“water without walking”
- Reach vulnerable sectors; sub-Saharan Africa & Asia
- Focus on sustainable implementation
- Strengthen local capacities – implementation and management
- Support the development of appropriate RWH technology
- Advocacy, gathering & sharing RWH expertise to enable policy & practice: promoting RWH as a viable water supply option

RAIN – approach

CONCLUSION AND RECOMMENDATIONS

STRENGTHS

- Level of satisfaction and acceptability is very high among users
- Rainwater offers a great range of benefits
- Water quality is good when systems are properly maintained
- O&M cost is low

WEAKNESSES

- Technology is somewhat costly
- Rainwater cannot fulfill the complete demand of an average Nepali family
- Involvement of LGB is still low
- Disadvantaged households are sometimes left out of the programme

OPPORTUNITIES

- Technical design can be improved
- Incentives can be given to enlarge the catchments area and the capacity of the tank
- Water reuse should be encouraged
- Self initiation rainwater harvesting systems can be encouraged by increasing market involvement and accessibility to credit
- Refreshing trainings and awareness campaigns should take place regularly

THREATS

- A poor technical design has a direct effect on water quality and sustainability of the system
- Operation and maintenance is sometimes inadequate
- Policy limits the implementation of household level rainwater harvesting programmes
- Some spare parts of the systems are not available in the market (nylon mesh, cap for wash pipe, etc)

RAIN – learning & development

- R&D: appropriate technology
- Performance Measurement & Learning (PMLS):
measuring impact → improvement

RESULTS:

20.800 m³ RWH storage capacity;

2007 - 12.500 people with drinking water;

2008 - 18.500 people (> 17.000 m³)

Working in 5 countries, 33 implementing orgs

2. RAIN and MUS: Opportunities & Bottlenecks

- Beyond drinking water to meet other (water) needs
- Understanding needs, water sources and patterns of use
- Water quality and quantity
- Developing the RAIN model: technical, institutional, financial; 'beneficiaries' to 'clients'; cross-sectorial; land & water management, livelihoods and wellbeing, women, environment

→ Towards upscaling: pilots, planning, partnerships

→ WASH & 3R

not just a small-scale water supply technical package, water efficiency, practical IWRM, water & food security

3. RAIN in Nepal

- BSP and a business model for biogas, microfinance
-and RWH in Nepal: mountains, food gardens

3. RAIN in West Africa: Mali, Burkina Faso & Senegal

- Dutch Government key donor – household drinking water
- 3 litres pp/d, dry periods
- “Type 3” areas, rural

3. RAIN in Ethiopia

- ERHA – Ethiopian Rainwater Harvesting Alliance
 - Communal drinking water supply
 - Swiss Re ReSource project; communal drinking water +
 - Partnerships, Capacity
 - Surface water runoff tanks & sand dams
 - Upscaling; Veld & Vecht
- **MUS advise: case study Ethiopia**
